# 1 Nearest Neighbours and the Curse of Dimensionality.

a) Expectation and variance of  $Z = (X - Y)^2$ , where  $X, Y \sim U(0, 1)$ :

**Expectation:** Expected value of iid random variable equals that variable multiplied by its PDF, integrated over all values of the variable. We assume X, Y are iid and P(X,Y) = P(X)P(Y).

$$E[Z] = \int Z \cdot P(Z) dZ$$

$$= \int_0^1 \int_0^1 (X - Y)^2 \cdot P(Y) P(X) dY dX$$

$$= \int_0^1 \int_0^1 (X - Y)^2 \cdot 1 \cdot 1 dY dX \qquad (X, Y \sim U(0, 1))$$

$$= \int_0^1 \int_0^1 (X - Y)^2 dY dX$$

Numerically:

```
def z(y, x):
    return (x-y) ** 2

# Expected Z
E_Z, E_Z_err = scipy.integrate.dblquad(
    z, # dYdX
    0, 1, # outside integral
    lambda x: 0, lambda x: 1, # inside integral)
print("E_Z: {}".format(E_Z))
```

#### Variance:

$$\begin{split} Var[Z] &= E[Z^2] - (E[Z])^2 \\ &= \int Z \cdot P(Z) \, dZ - (E[Z])^2 \\ &= \int_0^1 \int_0^1 (X - Y)^4 \cdot P(Y) P(X) \, dY \, dX - (E[Z])^2 \\ &= \int_0^1 \int_0^1 (X - Y)^4 \cdot 1 \cdot 1 \, dY \, dX - (E[Z])^2 \\ &= \int_0^1 \int_0^1 (X - Y)^4, dY \, dX - (E[Z])^2 \end{split}$$

Numerically:

```
# Variance definition: E[Z^2] - (E[Z])^2
exp_Z_sq, exp_Z_sq_err = scipy.integrate.dblquad(
    z_sq, # dYdX
    0, 1,
    lambda x: 0,
    lambda x: 1, # inside integral
    )

Var_Z = exp_Z_sq - (E_Z) ** 2
print("Var_Z: {}".format(Var_Z))

Result: Var_Z: 0.038888888888889, or 7/180
```

b) Expectation and variance of  $R = Z_1 + Z_2 + ... + Z_d$ :

**Expectation:** Given linearity of expectation, E[A + B] = E[A] + E[B]:

$$E[R] = E[Z_1] + E[Z_2] + \dots + E[Z_d]$$

 $Z_1, Z_2, ... Z_d$  are all iid and have same distribution as Z, therefore:

$$E[R] = d \cdot E[Z]$$

**Variance:** Given Var(X+Y) = Var(X) + Var(Y) + 2Cov(X,Y), and  $Cov(Z_i,Z_j) = 0$  since all Z's are iid:

$$Var[R] = Var[Z_1] + Var[Z_2] + \dots + Var[Z_d]$$
$$= \frac{d \cdot Var[Z]}{d \cdot Var[Z]}$$

Run some tests in Python to verify that the above is correct, for say, d=2:

```
total = 0
var_total = 0
trials = 1000000
d = 2
E_Z = 1/6
Var_Z = 7/180
for i in range(0, trials):
  for j in range(0, d):
    x = random.uniform(0,1)
    y = random.uniform(0,1)
    z = (x - y) ** 2
    total += z
    var_total += (z - E_Z) ** 2
print("Mean: {:0.5f} | Theoretical: {:0.5f} | delta: {:0.5f}".format(
  total / trials,
  E_Z * d,
  total / trials - E_Z * d))
print("Variance: {:0.5f} | Theoretical: {:0.5f} | delta: {:0.5f}".format(
  var_total / trials,
  Var_Z*d,
  var_total / trials - Var_Z*d))
Result:
Mean: 0.33374 | Theoretical: 0.33333 | delta: 0.00040
Variance: 0.07783 | Theoretical: 0.07778 | delta: 0.00005
```

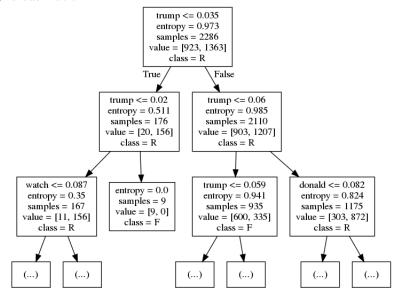

### 2 Decision Trees.

- a) Done in hw1\_code.py
- b) select\_model() output:

```
max_depth: 1 | criterion: gini
                                  | score: 0.5898
max_depth: 1 | criterion: entropy | score: 0.7143
max_depth: 2
             | criterion: gini
                                   | score: 0.6102
max_depth: 2 | criterion: entropy | score: 0.5980
max_depth: 3 | criterion: gini
                                   | score: 0.6878
max_depth: 3 | criterion: entropy | score: 0.6878
max_depth: 4 | criterion: gini
                                   | score: 0.6755
max_depth: 4
             | criterion: entropy |
                                     score: 0.6592
max_depth: 5 | criterion: gini
                                   | score: 0.6653
max_depth: 5 | criterion: entropy | score: 0.7469
max_depth: 6 | criterion: gini
                                   | score: 0.7204
max_depth: 6 | criterion: entropy | score: 0.7429
             | criterion: gini
max_depth: 7
                                     score: 0.6878
max_depth: 7
             | criterion: entropy | score: 0.7388
max_depth: 8 | criterion: gini
                                   | score: 0.8041
max_depth: 8 | criterion: entropy |
                                     score: 0.8163
             | criterion: gini
max_depth: 9
                                     score: 0.8122
                                   - 1
max_depth: 9 | criterion: entropy |
                                     score: 0.7367
max_depth: 10 | criterion: gini
                                   | score: 0.7510
max_depth: 10 | criterion: entropy | score: 0.8245
max_depth: 11 | criterion: gini
                                   | score: 0.7510
max_depth: 11 | criterion: entropy | score: 0.7367
max_depth: 12 | criterion: gini
                                     score: 0.7571
max_depth: 12 | criterion: entropy | score: 0.7612
max_depth: 13 | criterion: gini
                                   | score: 0.7694
max_depth: 13 | criterion: entropy | score: 0.8224
max_depth: 14 | criterion: gini
                                   | score: 0.7510
max_depth: 14 | criterion: entropy |
                                     score: 0.8327
max_depth: 15 | criterion: gini
                                   | score: 0.8347
max_depth: 15 | criterion: entropy | score: 0.8224
                                   | score: 0.8306
max_depth: 16 | criterion: gini
max_depth: 16 | criterion: entropy | score: 0.8347
max_depth: 17 | criterion: gini
                                   | score: 0.8245
max_depth: 17 | criterion: entropy | score: 0.8286
max_depth: 18 | criterion: gini
                                   - 1
                                     score: 0.8184
max_depth: 18 | criterion: entropy | score: 0.8490
max_depth: 19 | criterion: gini
                                     score: 0.8061
max_depth: 19 | criterion: entropy | score: 0.8306
max_depth: 20 | criterion: gini
                                   | score: 0.8265
max_depth: 20 | criterion: entropy | score: 0.8163
```

Best hyperparameters: max\_depth = 18, criterion = entropy, score = 0.8490

#### c) Visualization:

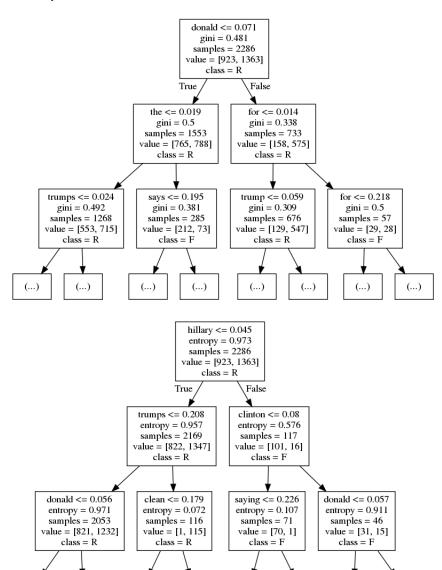

d) Outputs of compute\_information\_gain() for various keywords and Tfidf values. These correspond to initial splits in the other two images below.

Note that IG values are slightly off from what you'd calculate from the numbers in the diagram. Thresholds are manually passed to the function, and are likely rounded in the graphviz picture.

KEYWORD	- 1	Tfidf	THRESHOLD	-	IG
trump	- 1	0.035		-	0.0264
donald	- 1	0.071		-	0.0527
hillary		0.045		-	0.0353
